

My website's development revolves around a short summary of my life, the experiences that I have had, and the passions I have found throughout my life's journey. I have always gotten inspired by the idea of being able to develop my own personal website. However, I never truly took that first step in actually dedicating myself to developing a personal website of mine where I can showcase myself to other people. I took this final project as the perfect opportunity to be able to showcase the skills that I have learned through ITP303 and to be able to develop a website that I was truly inspired to build.

The way my site works is that it is a simple personal website that has a navigation bar to navigate through the various pages on my website. When you access the website, you can see there are a variety of personal experiences and projects that I have showcased. Each experience and project has a hyperlink to access more information on the things I have learned or utilized during my experiences or coding projects. Furthermore, I have implemented a passions tab where I showcase some of the passions that I have learned throughout my life. I have attached a few songs that I and my friends covered for fun and also a quick summary of each of my passions. More specifically, I have included a passion for working out which is what my database is revolved around.

I have developed my own workout database which allows people to search, add, edit, and delete workouts. These workouts are created based on my own experience of working out for multiple years.

Extras:

1. The first extra I have implemented into my website is the file upload on my passions tab. I implemented this extra because I thought it would be interesting if people could upload pictures of their favorite workouts or transformation pictures that really resonate with my passions

2. The second extra I have implemented into my website is the different permission levels.  
The various permission levels are:
  - a. Registered users: Can search and add workouts.
  - b. Admins: Can search, delete, edit, and add workouts to the database.
3. The third extra I have implemented into my website is pagination when displaying all the workouts in the search results. I thought that implementing the pagination extra would allow my workout database to look cleaner when displaying all of the results.
